## Summary

---

The Global Adult Tobacco Survey (GATS), a component of Global Tobacco Surveillance System (GTSS), is a global standard for systematically monitoring adult tobacco use and tracking key tobacco control indicators. GATS is a nationally representative household survey of adults 15 years of age or older using a standard core questionnaire, sample design, and data collection and management procedures that were reviewed and approved by international experts. GATS is intended to enhance the capacity of countries to design, implement and evaluate tobacco control interventions.

GATS is designed to produce national and sub-national estimates among adults across countries. The target population includes all non-institutionalized men and women 15 years of age or older who consider the country to be their primary place of residence. All members of the target population are sampled from the household that is their primary place of residence. All GATS countries use country-specific stratified multi-stage cluster sampling designs and an interview consisting of a household screening component and an individual component administered to the selected respondent. Data is collected using electronic handheld devices.

GATS Brazil was conducted in 2008 as a part of the Brazil National Household Sample Survey (PNAD). GATS Brazil used a multi-stage stratified sample with a total of 51,011 households (for 39,425 completed individual interviews) which is a subsample of one-third of the total households included in the PNAD. The GATS Brazil survey provides nationally representative estimates for urban-rural areas stratified by gender, in addition to five regional estimates. The GATS Brazil questionnaire includes core questions about background characteristics, tobacco smoking, smokeless tobacco, cessation, secondhand smoke, economics, media, and knowledge, attitudes and perceptions, and country-specific questions about hand-rolled cigarettes and pictorial health warnings. Questions were adapted in each section, then reviewed and approved by the questionnaire expert review committee. The questionnaire was administered in the Portuguese language using a software program developed by the Brazilian Institute of Geography and Statistics (IBGE) for electronic data collection using handhelds.

Personally-identifying information in the data file has been removed from this data file to protect confidentiality. Due to the complex sample design, clustering, stratification and sample weights should be taken into account in the data analysis in order to obtain proper point estimates and variances. The stratification, cluster and sample weight variables are `gatsstrata`, `gatscluster` and `gatsweight`, respectively. To access the GATS Brazil fact sheet and country report, please visit:

[www.cdc.gov/tobacco/global/gats/countries](http://www.cdc.gov/tobacco/global/gats/countries).
