## Summary

---

The Global Adult Tobacco Survey (GATS), a component of Global Tobacco Surveillance System (GTSS), is a global standard for systematically monitoring adult tobacco use and tracking key tobacco control indicators. GATS is a nationally representative household survey of adults 15 years of age or older using a standard core questionnaire, sample design, and data collection and management procedures that were reviewed and approved by international experts. GATS is intended to enhance the capacity of countries to design, implement and evaluate tobacco control interventions.

GATS is designed to produce national and sub-national estimates among adults across countries. The target population includes all non-institutionalized men and women 15 years of age or older who consider the country to be their primary place of residence. All members of the target population are sampled from the household that is their primary place of residence. All GATS countries use country-specific stratified multi-stage cluster sampling designs and an interview consisting of a household screening component and an individual component administered to the selected respondent. Data is collected using electronic handheld devices.

In Russian Federation, GATS was conducted in 2009 using a four-stage stratified cluster sample design to provide cross-sectional estimates for the country as a whole, as well as estimates by residence and by gender. The initial sample size was 12,000 households with 11,406 completed individual interviews. GATS Russian Federation questionnaire includes core questions about background characteristics, tobacco smoking, smokeless tobacco, cessation, secondhand smoke, economics, media, and knowledge, attitudes and perceptions. Questions were adapted in each section, then reviewed and approved by the questionnaire expert review committee. The questionnaire was administered in the Russian language using handheld devices.

The data file does not contain personal identifying information to ensure and protect confidentiality. Due to the complex sample design, clustering, stratification and sample weights should be taken into account in the data analysis in order to obtain proper point estimates and variances. The stratification, cluster and sample weight variables are gatsstrata, gatscluster and gatsweight, respectively. To access GATS Russian Federation fact sheet and country report, please visit:
